

## CMLE – a Problem, its Solution and a Useful Approximation

CMLE, Conditional Maximum Likelihood Estimation, produces statistically consistent item estimates for Rasch data, so that, as the person sample size increases, the CMLE item estimates converge to their true values. However there is a problem. The person theta estimates are not congruent with the item estimates. This is because CMLE, as usually implemented, only produces item estimates. These item estimates are then used as anchor values in AMLE, Anchored Maximum Likelihood Estimation, to produce theta estimates. The solution is to use CMLE for both the persons and the items. Both of these CMLE estimates can be approximated from JMLE results. Here are the details.

*John Michael Linacre*

1.	<i>Concept</i>	<i>Details</i>																																				
2.	<b>Situation 1:</b>	<b>The dichotomous data are symmetric</b>																																				
3.	Dataset 1: 4 items, E1, E2, E3, E4 4 persons, P1, P2, P3, P4	<table border="1" style="margin: auto; border-collapse: collapse;"> <thead> <tr> <th style="width: 5%;"></th> <th style="width: 10%;">E1</th> <th style="width: 10%;">E2</th> <th style="width: 10%;">E3</th> <th style="width: 10%;">E4</th> <th style="width: 10%;">Total</th> </tr> </thead> <tbody> <tr> <td>P1</td> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> </tr> <tr> <td>P2</td> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td style="text-align: center;">2</td> </tr> <tr> <td>P3</td> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> <td style="text-align: center;">1</td> <td style="text-align: center;">1</td> <td style="text-align: center;">3</td> </tr> <tr> <td>P4</td> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> <td style="text-align: center;">1</td> <td style="text-align: center;">2</td> </tr> <tr> <td>Total</td> <td style="text-align: center;">1</td> <td style="text-align: center;">2</td> <td style="text-align: center;">3</td> <td style="text-align: center;">2</td> <td style="text-align: center;"></td> </tr> </tbody> </table>		E1	E2	E3	E4	Total	P1	1	0	0	0	1	P2	0	1	1	0	2	P3	0	1	1	1	3	P4	0	0	1	1	2	Total	1	2	3	2

20.	<b>Solution 2:</b> Alignment procedure for CMLE person and item estimates using the probability matrices.	<p>The means of both the CMLE item and CMLE person estimates are set to 0.0, so the person distribution needs aligning to the item distribution.</p> <p>Step 1) Look for a cell with probability X near 0.5. Comparing these two probability matrices, we see that for P1/E4 the values bracket .50, so let's average them: <math>X = (0.528+0.482)/2 = 0.505</math></p> <p>Step 2) Identify the CMLE item easiness and CMLE person ability estimates for the cell. Example: <math>E4 = 1.065</math>, <math>P1 = -1.307</math></p> <p>Step 3) Add to the CMLE person estimates: Adjustment = <math>\ln(X/(1-X)) - \text{CMLE Item Easiness} - \text{CMLE Person Ability}</math> Example: <math>= \ln(0.505 / 0.495) - 1.065 - -1.307 = 0.262</math> logit adjustment</p> <p style="text-align: center;">Aligned CMLE Ability Theta</p> <p><math>P1 = -1.045</math>, <math>P2 = -0.022</math>, <math>P3 = -0.022</math>, <math>P4 = 1.199</math>, <math>P5 = 1.199</math></p>																																										
21.	<b>A useful approximation</b>	<b>CMLE estimates from CMLE or JMLE probabilities</b>																																										
22.	JMLE: Here is the matrix of expected probabilities for Dataset 2 at the end of item and person estimation. This matrix is symmetric.	<table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th></th> <th>E1</th> <th>E2</th> <th>E3</th> <th>E4</th> <th>Total</th> </tr> </thead> <tbody> <tr> <th>P1</th> <td>0.032</td> <td>0.232</td> <td>0.232</td> <td>0.505</td> <td>1.000</td> </tr> <tr> <th>P2</th> <td>0.115</td> <td>0.542</td> <td>0.542</td> <td>0.800</td> <td>2.000</td> </tr> <tr> <th>P3</th> <td>0.115</td> <td>0.542</td> <td>0.542</td> <td>0.800</td> <td>2.000</td> </tr> <tr> <th>P4</th> <td>0.369</td> <td>0.842</td> <td>0.842</td> <td>0.947</td> <td>3.000</td> </tr> <tr> <th>P5</th> <td>0.369</td> <td>0.842</td> <td>0.842</td> <td>0.947</td> <td>3.000</td> </tr> <tr> <th>Total</th> <td>1.000</td> <td>3.000</td> <td>3.000</td> <td>4.000</td> <td></td> </tr> </tbody> </table>		E1	E2	E3	E4	Total	P1	0.032	0.232	0.232	0.505	1.000	P2	0.115	0.542	0.542	0.800	2.000	P3	0.115	0.542	0.542	0.800	2.000	P4	0.369	0.842	0.842	0.947	3.000	P5	0.369	0.842	0.842	0.947	3.000	Total	1.000	3.000	3.000	4.000

P4	0.369	0.842	0.842	0.947	3.000																																							
P5	0.369	0.842	0.842	0.947	3.000																																							
Total	1.000	3.000	3.000	4.000																																								
23.	Coincidences between cell probabilities: CMLE items, CMLE persons, JMLE	<p>1) Marginal item (column) and person (row) totals are the same for all three probability matrices. Though JMLE estimates are more dispersed than CMLE estimates, their totals are the same.</p> <p>2) Probabilities in the cells of all three matrices are functionally the same. Conclusions based on cell probabilities, such as standard errors and mean-square fit statistics, are effectively the same for JMLE and CMLE.</p> <p>JMLE cell probabilities approximate CMLE cell probabilities.</p>																																										
24.	The CMLE theory	<p>For a person score of 1, for any pair of items, here items 1 and 2, <math>\text{Exp}(E1) / \text{Exp}(E2) = \text{Probability}(E1)/\text{Probability}(E2)</math> Example using CMLE item probabilities, person P1, score 1, <math>\text{Exp}(E1) / \text{Exp}(E2) = \text{Exp}(-1.385)/\text{Exp}(0.160) = 0.213</math> <math>\text{Probability}(E1)/\text{Probability}(E2) = 0.046/0.213 = 0.216</math> These values are effectively equal. CMLE theory confirmed.</p>																																										
25.	Approximate CMLE estimates from CMLE/JMLE probabilities	<p>Since all the probability matrices are similar, approximate CMLE item or CMLE person estimates can be obtained from CMLE item or CMLE person or JMLE cell probabilities for a person or item with a score of 1.</p>																																										

26.	Approximate CMLE item estimates from the CMLE person or JMLE probability matrices	<p>Step 1) Using a CMLE person or JMLE probability matrix, identify or generate a person with a score of 1. Example: P1</p> <p>Step 2) Compute the probabilities (expected values) for every item. Example from the JMLE matrix: 0.039 0.232 0.232 0.505</p> <p>Step 3) Identify a probability, Pmiddle, in the middle of the range. Assign its item an estimate of 0 logits with <math>\text{Exp}(0) = 1</math>. Example: Pmiddle = 0.232, E2 = 0.000 logits</p> <p>Step 4) The CMLE estimates for all the other items are: Target Item estimate = <math>\ln(\text{target item probability} / \text{Pmiddle})</math> Example: E1, E2, E3, E4 = -1.783, 0.000, 0.000, 0.778</p> <p>Step 5) Subtract the mean of all the item estimates from each of the item estimates. These are now the approximate CMLE item estimates. Example: mean = -0.251 E1 = -1.532, E2 = 0.251, E3 = 0.251, E4 = 1.029</p>
27.	Three sets of “CMLE” item estimates:	<p>Exact: CMLE Item Easiness directly or from CMLE item probabilities E1 = -1.385, E2 = 0.160, E3 = 0.160, E4 = 1.065</p> <p>Approximate: CMLE Item Easiness from CMLE person probabilities E1 = -1.535, E2 = 0.278, E3 = 0.278, E4 = 0.979</p> <p>Approximate: CMLE Item Easiness from JMLE probabilities E1 = -1.532, E2 = 0.251, E3 = 0.251, E4 = 1.029</p> <p>Note: in this example, item estimates from JMLE probabilities are closer to exact item CMLE than item estimates from CMLE person probabilities.</p>
28.	Approximate CMLE person estimates	Same estimation procedure as above using the CMLE item or JMLE probabilities for an item with a score of 1.
29.	Three sets of “CMLE” person estimates (unaligned):	<p>Exact: CMLE Ability Theta directly or from CMLE person probabilities P1 = -1.307, P2 = -0.284, P3 = -0.284, P4 = 0.937, P5 = 0.937</p> <p>Approximate: CMLE Ability Theta from CMLE item probabilities P1 = -1.238, P2 = -0.140, P3 = -0.140, P4 = 0.759, P5 = 0.759</p> <p>Approximate: CMLE Ability Theta from JMLE probabilities P1 = -1.331, P2 = -0.250, P3 = -0.250, P4 = 0.916, P5 = 0.916</p> <p>Note: in this example, person estimates from JMLE probabilities are closer to exact person CMLE than person estimates from CMLE item probabilities.</p>
30.	Aligning CMLE person and CMLE item estimates (exact or approximate)	Same alignment procedure as above. Notice that for P1/E4 the JMLE probability is 0.505, the average value we obtained above.

31.	Advantages of using the JMLE probability matrix to obtain approximate CMLE estimates	<ol style="list-style-type: none"><li>1) JMLE computation is faster for large matrices</li><li>2) JMLE easily accommodates missing data</li><li>3) JMLE probability matrix and JMLE-based CMLE estimates are symmetric for symmetric data</li><li>5) Using zero-weighted dummy items and persons, JMLE generates probability matrices which include all possible person and item scores for CMLE-compatible item and person score-to-measure tables.</li></ol>
